Instrument

Continuous sea surface water monitoring system

Overview

Thermosalinograph measures the following surface parameters continuously.

- temperature
- salinity
- dissolved oxygen

Sea surface water is continuously pumped up at 2.9 meters depth to the No.2 Laboratory and then flowed into each analyzer.

The flow rate of this system is controlled.

Number of significant figures of data

After considering the accuracy of the sensors, the significant digit of data was changed as in the following list.

Zero padding was applied to the temperature data published on this site.

Item	Raw data	On this data
Temperature	0.1[deg-C]	0.1 [deg-C]
Salinity	0.001 [PSU]	0.001 [PSU]
Dissolved oxygen	0.001 [%]	0.1 [μ mol/kg]

Data processing

Processed(DMO)-Qced data are flagged after the data check process shown below:

1) Data processing

The raw data was recorded every 30 seconds intervals

The data published on this site was created as 1 minute data by extracting the raw data whose time within ± 15 seconds is closer to 00 second.

2) Dissolved oxygen data unit was convert from saturation to concentration (μ mol/kg).

3) Range check

For details about range set of temperature, salinity and oxygen data, please see the following reference of NODC (National Oceanographic Data Center) .

Quality control and processing of historical oceanographic temperature, salinity, and oxygen data.

* <https://repository.library.noaa.gov/view/noaa/13443>

4) Visual check

If an value were extremely out from time-series plot of each variable or were affected by ambient air due to unstable flow of sampled water, it may be put flag "A" which means doubtful value.

About this data

1) This cruise obtained data of fluorescence and turbidity in addition to data of temperature, salinity and dissolved oxygen.

If you would like these data set, please contact DMO at "dmo@jamstec.go.jp".

2) Salinity and dissolved oxygen data obtained during the following term were flagged "A" because intermittent noise was observed in the salinity data.
