#### CONTENTS

#### Summary

- 1. Survey outline
  - 1.1 Survey Area
  - 1.2 Time schedule
  - 1.3 Weather and sea status
  - 1.4 Participants
- 2. Observation system
- 3. Survey specifications
- 4. MCS onboad processing result

#### List of Tables and Figures

- Table 1. Time schedule
- Table 2. Participants in KR00-02 cruise
- Table 3. Specification of MCS data acquisition
- Figure 1. Survey area and seismic lines
- Figure 2. Onbord-processing example of MCS data on Line AM102

#### Attachments

- Attachment 1 Observation systems for MCS reflection survey
- Attachment 2 Data Sheets of MCS reflection survey
- Attachment 3 SeaBeam contour map along the MCS survey lines

#### Summary

The KR00-02 cruise was conducted as a part of the following researches:

- (1) Frontier research program for subduction dynamics
- (2) Ocean floor dynamics research

which are being carried out by Japan Marine Science and Technology Center (JAMSTEC). Main objective of this cruise is to make geophysical and geological observations of subduction zones at the northern Japan Trench region where is known as one of the most active seismogenic zone in Japan, in support of revealing the mechanism of subduction zone earthquakes.

During the cruise we used the R/V KAIREI of JAMSTEC to conduct a high-resolution multichannel seismic (MCS) reflection survey in the Japan Trench off the Miyagi and Aomori prefectures of northeastern Japan from 23 April to 10 May, 2000. The survey area is shown in Figure 1.

We acquired total ca. 719 km of MCS data on three survey lines by a 156-channel digital streamer cable. Eight 1500 cubic inch air guns were used as the seismic energy source. The survey lines are shown in Figure 2. An onboard-processing result of the Line AM102 was shown in Figure 3.

#### 1. Survey outline

#### 1.1 Survey area

The survey area of KR00-02 cruise is located at the northern Japan Trench off Miyagi and Aomori prefectures, as shown in Figure 1. During the survey, following four survey lines were initially planned. However, the MCS observation was actually carried out on three survey lines because of some instrumental trouble of profiling system: AM102, AM201, and MY202.

Line Name	Direction	Length planned	Length observed
AM102	E-W	203 km	214 km
AM201	N-S	330 km	348 km
MY202	SSW-NNE	148 km	157 km
MY102-3	E-W	136 km	not observed
Total	Line Length	817 km	719 km

#### 1.2 Time schedule

The R/V *KAIREI* has left the JAMSTEC Natsushima port on 23 April 2000, and has come back to the JAMSTEC port on 10 May 2000 in this cruise. In this cruise the *KAIREI* dropped at Sekinehama port from 28 April to 30 April for open house.

During Leg 1 (from 23 April to 30 April), we conducted some examinations of the MCS data acquisition system such as streamer-cable balancing modification, data telemetry testing of a recording system and a navigation system.

During Leg 2 (from 1 May to 10 May), we acquired the MCS data on total three survey lines. The survey lines were shown in Figure 2.

A detailed time schedule is shown in Table 1.

#### 1.3 Weather and sea status

Fortunately, weather in the survey area was almost fine through the survey, so that sea status was mostly stable except for a few days with highly windy weather.

#### 1.4 Participants

Participant researchers of KR00-02 cruise are as follows:

Tetsuro TSURU, Frontier research program for subduction dynamics, JAMSTEC (Chief scientist) Jin-Oh PARK, Frontier research program for subduction dynamics, JAMSTEC (Chief scientist) Toshihko HIGASHIKATA, Frontier research program for subduction dynamics,

#### **JAMSTEC**

Participants who have taken the vessel as engineers, officers and crew are shown in Table 2a and 2b.

#### 2. Observation system

The observation systems for MCS reflection survey are as follows:

· Streamer cable: Syntron 24-bit digital streamer

· Air gun: Bolt par airgun Model 1500

· Recording system: Syntron SYNTRAK 960

· Navigation system: Concept SPECTRA

· Processing software: JGI iXL

Detailed information of the above systems are shown in the Attachment 1.

Furthermore, we used the following systems for acquiring other geophysical data.

- · Shipboard three component magnetometer: Tierra Technica, SFG-11214
- Proton precession magnetometer: Kawasaki Geological Engineering Co., LTD,
   PRT10 magnetometer
- · Gravity meter: BODENSEEWERK, KSS31 marine gravity meter
- · Multi-narrow beam: SeaBeam Instruments, SEA BEAM 2112

#### 3. Survey specifications

The specifications of MCS reflection data acquisition are shown in Table 3.

#### 4. MCS onboard-processing result

We have conducted onboard processing of MCS data by the iXL software. Figure 3 shows a CDP stacked section of the line AM102. From this section, we can recognize some horst-graben structures accompanying normal faults at the top of subducting oceanic crust and a landward dipping reflector with strong amplitude (a backstop interface) in the overriding island arc crust. We could identify a strong reflector below very wide, gentle continental slope, by which upper Neogene strata is separated from lower Cretaceous basement. We interpret the reflector as an unconformity surface geologically.

Table 1. 調查日程表

月日	時刻	作業項目	備考
