Overview

Primary Production Data during MR01-K02 cruise were obtained by the following methods :

- Photosynthesis and irradiation curve method during underway (PI_underway) Water sampling, incubation, and devices and tracers for analysis for each method are outlined below.

For further information, please see Cruise Report.

Outline of water sampling, incubation, and analysis

Photosynthesis and irradiation curve underway (PI_underway) [Outline figure](#)

- 1) Surface sampling : Sea surface water is continuously pumped up at 4.5 meters depth to the sea surface monitoring laboratory and then flowed into each analysis device through a steel pipe and a vinyl-chloride pipe.
- 2) Sampling layer : 1
- 3) Tracer : $\text{NaH}^{13}\text{CO}_3$
- 4) Incubation period : 3hours
- 5) Filtration : Whatman GF/F filter was used at dark place.
- 6) Preservation : Filters were kept to freeze at -20degC and dried in the oven at 45degC.
- 7) Preservation period of frozen filter paper : within 45 days
- 8) Analysis place : MIRAI
- 9) Analysis device : CN mass spectrometer (see section 3 and 4 for detail)
- 10) Analysis method: Dumas method, Mass spectrometry

About CN mass spectrometer

CN mass spectrometer system equipped with R/V Mirai can measure stable isotope ratios of ^{13}C and ^{15}N comprised in liquid, solid, and gas states of biological or biogenic samples, simultaneously and continuously. This system consists of two devices, preprocessing equipment "ROBOPLEP-SL" and stable isotope ratio mass spectrometer "EUROPA20-20".

(1) ROBOPLEP-SL

A tin capsule containing the sample falls into the combustion tube and is converted in the presence of oxygen to CO_2 , N_2 , NO_x and H_2O . An elemental copper stage reduces NO_x , a MgClO_4 trap removes water vapour, a switchable Carbosorb trap can be used to remove CO_2 (for ^{15}N only analyses) and a GC column separates CO_2 from N_2 (allowing dual isotope analysis). And then, it is introduced into the "EUROPA20-20".

(2) EUROPA20-20

CO_2 and N_2 are collided with thermion and ionized in the high vacuum ion source. When the generated ions are accelerated by constant voltage and pass through the analysis tube, differences in mass (m) and electric charge (z) of isotope ions make the different orbits by the magnetic field in the analysis tube. Thus, isotopes can be separated by the displacement of the orbits. These signals are converted into the frequency at the detector, and transmitted to control PC. Blank and drift corrections are conducted on the control software.
