Instrument

Instrument:

Shipboard gravimeter (- KR16-07)

Instrument:

Microgravimeter (KR08-02 -)

Overview

The data provided here are quality-controlled absolute gravity data and free-air anomalies. The absolute gravity data are a combination of relative gravity data measured by the shipboard gravity meter and the absolute gravity data of the ports in departure and arrival. Drift corrections and the Eotvos corrections were done before converting into absolute gravity. As a quality control, low reliability data were removed (see section 6. for the judging criteria). The absolute gravity values of the ports are referenced to those of the Japan Gravity Standardization Net of the Geographical Survey Institute of Japan.

Measurement System

(1) Shipboard gravity meter

The system consists of two main assemblies; the gyro-stabilized platform including the gravity sensor and the data handling & control system.

Manufacturer: BODENSEEWERK

Model: KSS 31

Measuring range : 10,000 mGal

Accuracy : 1.0 mGal

Drift rate: < 3.0 mGal/month

Installation : Gravity meter room

Reference:"INSTRUCTION MANUAL for MARINE/AIR GRAVITYMETER SYSTEM KSS 31", Bodenseewerk 1996

(2) Portable gravity meter

The portable gravity meter consists of two modules; the data acquisition/control module and the gravity sensor module. The gravity sensor is enclosed in a thermostatically controlled vacuum chamber. The portable gravity meter is used to calculate the absolute gravity of the port with reference to the gravity station of the Japan Gravity Standardization Net of the Geographical Survey Institute of Japan.

Manufacturer: SCINTREX

Model: CG-5

Measuring range: 8,000 mGal

Standard deviation: 0.005mGal

Drift rate: < 0.02 mGal/day

Reference:"CG-5 OPERATION MANUAL", SCINTREX

Absolute gravity in Ports

Date (UTC)	Port	Absolute gravity (mGal)	Sea level (cm)	Draft shipboard (cm)	Absolute gravity at sensor position (mGal)	Reading of shipboard gravity meter (mGal)
2009-10-29 21:57:13	YOKOSUKA/JAMSTEC	979759.37	273	460	979760.06	-1440.7
2009-11-16 21:40:34	YOKOSUKA/JAMSTEC	979758.40	215	460	979758.91	-1439.7

* see [Term description](#)

Data processing

According to the filter process of the gravity meter system, the gravity data has a time lag of 103 seconds between the measurement and its output. After adjustment of this lag time, the following corrections and calculations were performed.

adjustment of this lag time, the following corrections and calculations were performed.

(1) Drift correction

$$D = ((V_{ge}-V_{gs})-(Age-A_{gs}))/ (T_e-T_s)$$

D: Drift value (mGal/day)

V_{gs}: The shipboard gravity at the start of the cruise (mGal)

V_{ge}: The shipboard gravity at the end of the cruise (mGal)

A_{gs}: The absolute gravity at the shipboard sensor position at the start of the cruise (mGal)

A_{ge}: The absolute gravity at the shipboard sensor position at the end of the cruise (mGal)

T_s: The start time of the cruise (day)

T_e: The end time of the cruise (day)

(2) Eotvoes correction

$$E = 7.503 \times S \times \cos(\varphi) \times \sin(\alpha) + 0.004154 \times S^2$$

E: Eotvoes correction (mGal)

S: Ground speed of the ship (knot)

φ: Latitude (radian)

α: Course of the ship (radian, measured clockwise from the north)

Reference: Blakely,R.J., Potential theory in gravity & magnetic applications, Cambridge University Press,New York,441pp,1995

* The navigation data such as S,φand αare the 4-min average values. Before average processing, following data were removed from each dataset. If the number of data used for a 4-min average calculation did not include more than 50% of good data, the processed average value was considered as a missing value.

- Time error (inversion of time, continuation of same timestamps)
- Ship speed exceeding 20knot
- Course of the ship except 0-360°

(3) Calculation of the absolute gravity

$$G = A_{gs} + (V_{g}-V_{gs}) \cdot D \cdot (T-T_s) + E + H \cdot \beta$$

G: The absolute gravity at sea surface (mGal)

A_{gs}: The absolute gravity at the shipboard sensor position at the start of the cruise (mGal)

V_{gs}: The shipboard gravity at the start of the cruise (mGal)

V_g: The shipboard gravity at the measurement time (mGal)

D: Drift value (mGal/day)

T_s: The start time of the cruise (day)

T: The measurement time (day)

E: Eotvoes correction (mGal)

H: Height from sea surface of the shipboard sensor position (m)

k: Gravitational constant

β: Free-air gradient 0.3086 (mGal/m)

(4) Calculation of the Free-air anomaly

$$G_f = G - \gamma + \delta$$

G_f: The Free-air anomaly (mGal)

G: Absolute gravity at sea surface (mGal)

γ: Normal gravity(mGal)

*The normal gravity formula of the Geodetic Reference System 1980

$$\gamma = 978032.67715 (1 + 0.0052790414 \sin^2 \varphi + 0.0000232718 \sin^4 \varphi + 0.0000001262 \sin^6 \varphi + 0.0000000007 \sin^8 \varphi)$$

δ: Atmospheric correction at sea surface

$$\delta = 0.87 - 0.0000965 \times 0 \text{ (mGal)}$$

(5) Output of the data

Time (UTC)

Latitude (degree)

Longitude (degree)

Processed absolute gravity at sea surface (mGal)

Free-air anomaly (mGal)

Quality control of data

Following criteria were used for removal of low reliability data:

- Abrupt free-air anomaly change exceeding 10mGal/km
- Change in Eotvoes correction exceeding 3mGal/min
- Ground speed of the ship below 3knot

Note

(1) File naming rule: Cruise ID_corr.grv

(2) Sampling rate: ten seconds

(3) Geodetic system: WGS84

(4) If you would like the raw data set, please contact us from "Contact Us" above.
